46 pages have duplicate meta descriptions

46 0

About this issue: Our crawler reports pages that have duplicate meta descriptions only if they are exact matches. A <meta description> tag is a short summary of a webpage's content that helps search engines understand what the page is about and can be shown to users in search results. Duplicate meta descriptions on different pages mean a lost opportunity to use more relevant keywords.
Also, duplicate meta descriptions make it difficult for search engines and users to differentiate between different webpages. It is better to have no meta description at all than to have a duplicate one. How to fix: Provide a unique, relevant meta description for each of your webpages.
For information on how to create effective meta descriptions, please see this Google article: https://support.google.com/webmasters/answer/35624.

20 internal links are broken

20 0

About this issue: Broken internal links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource.
If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

10 pages returned 4XX status code

10 0

About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability.
This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: 1.
DDoS protection system. 2. Overloaded or misconfigured server.
How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1.
Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt.

8 issues with duplicate title tags

8 0

About this issue: Our crawler reports pages that have duplicate title tags only if they are exact matches. Duplicate <title> tags make it difficult for search engines to determine which of a website's pages is relevant for a specific search query, and which one should be prioritized in search results. Pages with duplicate titles have a lower chance of ranking well and are at risk of being banned.
Moreover, identical <title> tags confuse users as to which webpage they should follow. How to fix: Provide a unique and concise title for each of your pages that contains your most important keywords. For information on how to create effective titles, please see this Google article: https://support.google.com/webmasters/answer/35624.

5 pages have duplicate content issues

5 0

About this issue: Webpages are considered duplicates if their content is 85% identical. Having duplicate content may significantly affect your SEO performance. First of all, Google will typically show only one duplicate page, filtering other instances out of its index and search results, and this page may not be the one you want to rank.
In some cases, search engines may consider duplicate pages as an attempt to manipulate search engine rankings and, as a result, your website may be downgraded or even banned from search results. Moreover, duplicate pages may dilute your link profile. How to fix.
Here are a few ways to fix duplicate content issues: 1. Add a rel="canonical" link to one of your duplicate pages to inform search engines which page to show in search results. 2. Use a 301 redirect from a duplicate page to the original one. 3. Use a rel="next" and a rel="prev" link attribute to fix pagination duplicates.
4. Instruct GoogleBot to handle URL parameters differently using Google Search Console. 5. Provide some unique content on the webpage. For more information, please read these articles: https://support.google.com/webmasters/answer/66359?hl=en and https://support.google.com/webmasters/answer/139066?hl=en.

Robots.txt file has format errors 1 0

About this issue: If your robots.txt file is poorly configured, it can cause you a lot of problems. Webpages that you want to be promoted in search results may not be indexed by search engines, while some of your private content may be exposed to users. So, one configuration mistake can damage your search rankings, ruining all your search engine optimization efforts.
How to fix: Review your robots.txt file and fix all errors, if there are any. You can check your file using Google's robots.txt Tester: https://www.google.com/webmasters/tools/robots-testing-tool. For information on how to configure your robots.txt, please see this article: https://developers.google.com/webmasters/control-crawl-index/docs/robots_txt.

0 pages returned 5XX status code	0 0

149 issues with unminified JavaScript and CSS files

149 0

About this issue: Minification is the process of removing unnecessary lines, white space and comments from the source code. Minifying JavaScript and CSS files makes their size smaller, thereby decreasing your page load time, providing a better user experience and improving your search engine rankings. For more information, please see this Google article https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency.
How to fix: Minify your JavaScript and CSS files. If your webpage uses CSS and JS files that are hosted on an external site, contact the website owner and ask them to minify their files. If this issue doesn't affect your page load time, simply ignore it.

25 pages have low text-HTML ratio

25 0

About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content.
That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster.
How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

13 pages have a low word count

13 0

About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts.
For more information, please view this video: https://www.youtube.com/watch?v=w3-obcXkyA4. How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.

12 issues with uncached JavaScript and CSS files

12 0

About this issue: This issue is triggered if browser caching is not specified in the response header. Enabling browser caching for JavaScript and CSS files allows browsers to store and reuse these resources without having to download them again when requesting your page. That way the browser will download less data, which will decrease your page load time. And the less time it takes to load your page, the happier your visitors are. For more information, please see this Google article https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency. How to fix: If JavaScript and CSS files are hosted on your website, enable browser caching for them.
If JavaScript and CSS files are hosted on a website that you don't own, contact the website owner and ask them to enable browser caching for them. If this issue doesn't affect your page load time, simply ignore it.

6 pages have duplicate H1 and title tags — 6 | 0

About this issue: It is a bad idea to duplicate your title tag content in your first-level header. If your page's <title> and <h1> tags match, the latter may appear over-optimized to search engines. Also, using the same content in titles and headers means a lost opportunity to incorporate other relevant keywords for your page.
For more information, please see this Google article: https://support.google.com/webmasters/answer/35624. How to fix: Try to create different content for your <title> and <h1> tags.

5 pages don't have an h1 heading — 5 | 0

About this issue: While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly.
How to fix: Provide a concise, relevant h1 heading for each of your page.

4 pages have underscores in the URL — 4 | 0

About this issue: When it comes to URL structure, using underscores as word separators is not recommended because search engines may not interpret them correctly and may consider them to be a part of a word. Using hyphens instead of underscores makes it easier for search engines to understand what your page is about. Although using underscores doesn't have a huge impact on webpage visibility, it decreases your page's chances of appearing in search results, as opposed to when hyphens are used.
For more information, please see this Google article: https://support.google.com/webmasters/answer/76329?hl=en. How to fix: Replace underscores with hyphens. However, if your page ranks well, we do not recommend that you do this.

Sitemap.xml not indicated in robots.txt — 1 | 0

About this issue: If you have both a sitemap.xml and a robots.txt file on your website, it is a good practice to place a link to your sitemap.xml in your robots.txt, which will allow search engines to better understand what content they should crawl. How to fix: Specify the location of your sitemap.xml in your robots.txt. To check if Googlebot can index your sitemap.xml file, use the Sitemaps report in Google Search Console: https://search.google.com/search-console/not-verified?original_url=/search-console/sitemaps&original_resource_id.

0 external links are broken — 0 | 0

0 external images are broken — 0 | 0

0 links on HTTPS pages lead to HTTP page — 0 | 0

0 pages don't have enough text within the title tags — 0 | 0

0 pages have too much text within the title tags	0	0
0 pages don't have meta descriptions	0	0
0 pages have too many on-page links	0	0
0 URLs with a temporary redirect	0	0
0 images don't have alt attributes	0	0
0 pages have too many parameters in their URLs	0	0
0 pages have no hreflang and lang attributes	0	0
0 pages don't have character encoding declared	0	0
0 pages don't have doctype declared	0	0
0 pages have incompatible plugin content	0	0
0 pages contain frames	0	0
0 outgoing internal links contain nofollow attribute	0	0

57 0

31 pages have only one incoming internal link 31 0

About this issue: Having very few incoming internal links means very few visits, or even none, and fewer chances of placing in search results. It is a good practice to add more incoming internal links to pages with useful content. That way, you can rest assured that users and search engines will never miss them.
How to fix: Add more incoming internal links to pages with important content.

20 links have non-descriptive anchor text 20 0

About this issue: This issue is triggered if a non-descriptive anchor text is used for a link (either internal or external). An anchor is considered to be non-descriptive if it doesn't give any idea of what the linked-to page is about, for example, "click here", "right here", etc. This type of anchor provides little value to users and search engines as it doesn't provide any information about the target page.
Also, such anchors will offer little in terms of the target page's ability to be indexed by search engines, and as a result, rank for relevant search requests. For more information on the criteria used to trigger this check, refer to kb article title. How to fix: To let users and search engines understand the meaning of the linked-to page, use a succinct anchor text that describes the page's content.
For best practices on how to optimize your anchor text, refer to the "Write good link text" section in Google's Search Engine Optimization (SEO) Starter Guide https://support.google.com/webmasters/answer/7451184?hl=en&ref_topic=9460495&authuser=0.

3 pages have more than one H1 tag 3 0

2 subdomains don't support HSTS 2 0

1 link on this page have no anchor text 1 0

About this issue: This issue is triggered if a link (either external or internal) on your website has an empty or naked anchor (i.e., anchor that uses a raw URL), or anchor text only contains symbols. Although a missing anchor doesn't prevent users and crawlers from following a link, it makes it difficult to understand what the page you're linking to is about. Also, Google considers anchor text when indexing a page.
So, a missing anchor represents a lost opportunity to optimize the performance of the linked-to page in search results. How to fix: Use anchor text for your links where it is necessary. The link text must give users and search engines at least a basic idea of what the target page is about.
Also, use short but descriptive text. For more information, please see the "Use link wisely" section in Google's SEO Starter Guide https://support.google.com/webmasters/answer/7451184?hl=en&ref_topic=9460495&authuser=0.

0 pages are blocked from crawling 0 0

0 page URLs are longer than 200 characters	0	0
0 outgoing external links contain nofollow attributes	0	0
Robots.txt not found	0	0
0 pages have hreflang language mismatch issues	0	0
0 orphaned pages in Google Analytics	0	0
0 orphaned pages in sitemaps	0	0
0 pages blocked by X-Robots-Tag: noindex HTTP header	0	0
0 issues with blocked external resources in robots.txt	0	0
0 issues with broken external JavaScript and CSS files	0	0
0 pages need more than 3 clicks to be reached	0	0
0 URLs with a permanent redirect	0	0
0 resources are formatted as page link	0	0
0 links to external pages or resources returned a 403 HTTP status code	0	0
